LOUISIANA WEEKLY CLIMATE SUMMARY

Volume 2, Issue 36

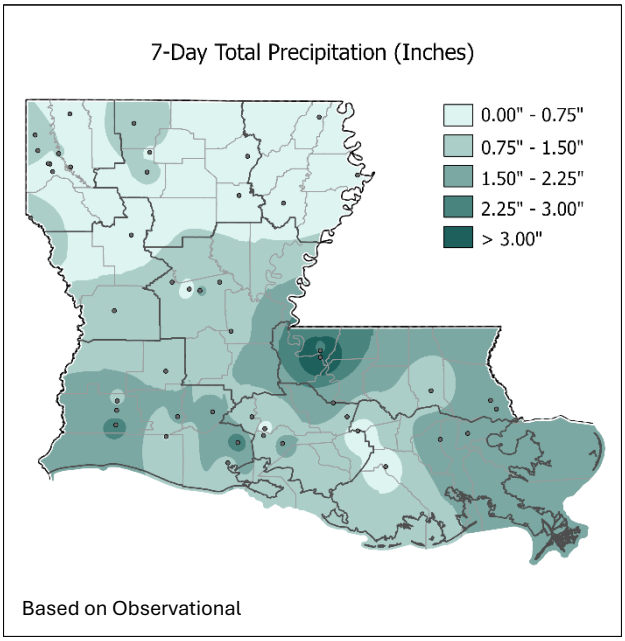

September 02 – September 08, 2026

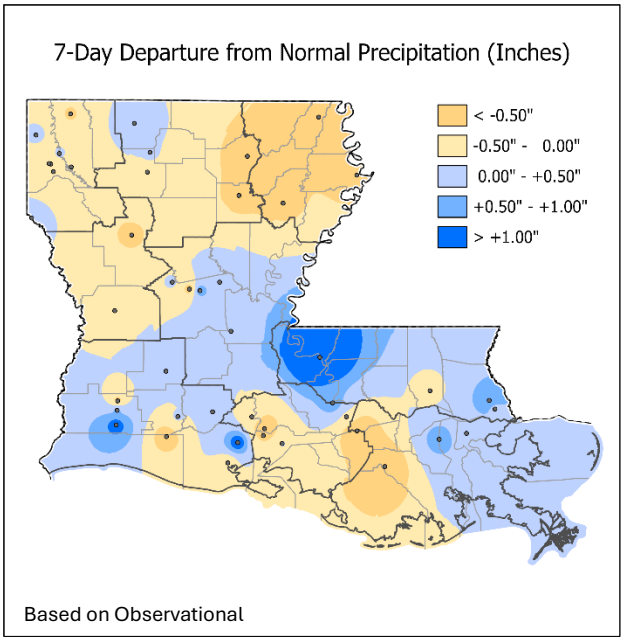

** PROVISIONAL DATA*

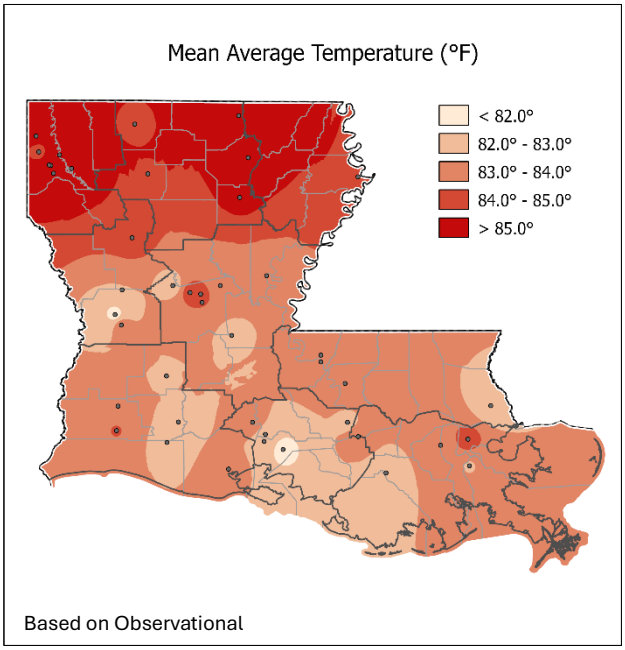

Louisiana Office of State Climatology
Louisiana State University
lastateclimate@lsu.edu
225-578-6870

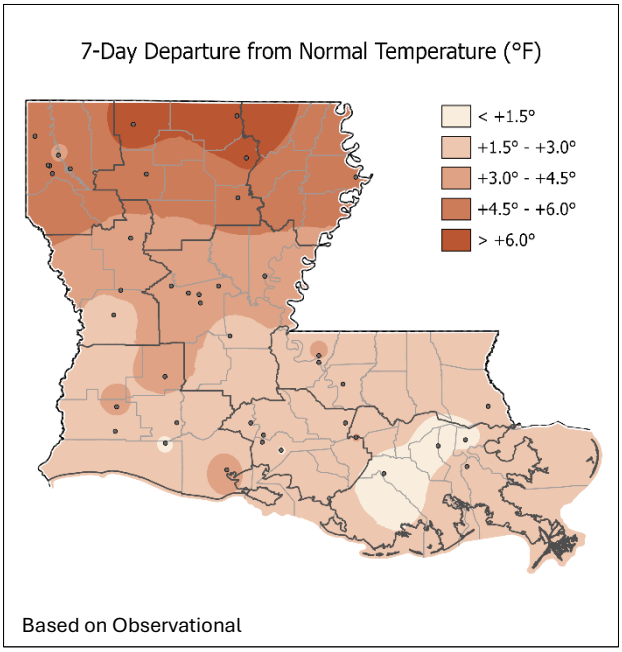

7-Day Accumulated Rainfall & Average Temperatures: 02 - 08 Sept 2026

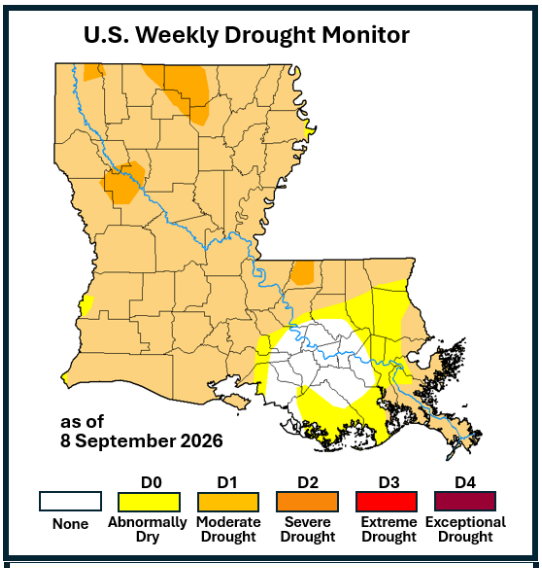

- it was an active 7-day run across the state due to the remnants of Edouard followed by a surface trough over the Gulf that moved into Louisiana; a front moved into the state during the latter portion of the period and served as the focus for active weather (p. 6)
- about half of the state recorded rainfall amounts above 7-day normals
- 7-day rain totals were enough to slow (but not stop) drought expansion and even led to small areas of improvement in the ***U.S. Drought Monitor*** (p. 3)

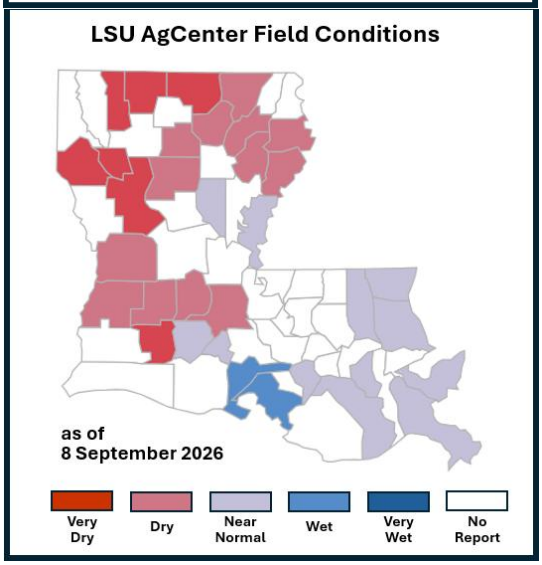

- it was another run of average temperatures above 7-day normals, particularly across the northern portion of the state where 7-day rains were lowest
- three climate divisions had at least one station exceed 100°F during the period

Louisiana Office of State Climatology

lastateclimate@lsu.edu
225-578-6870

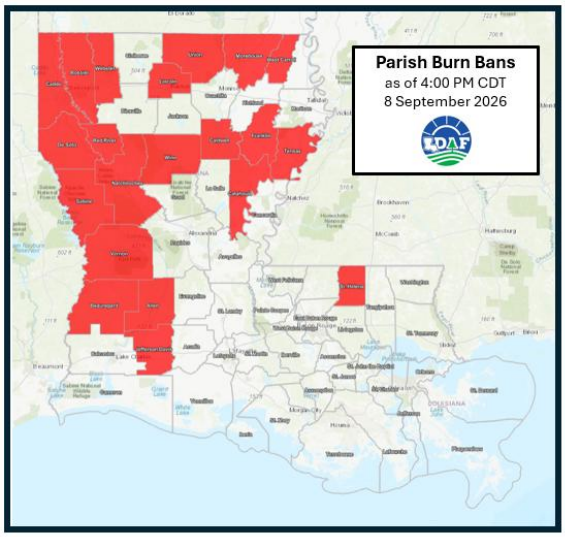

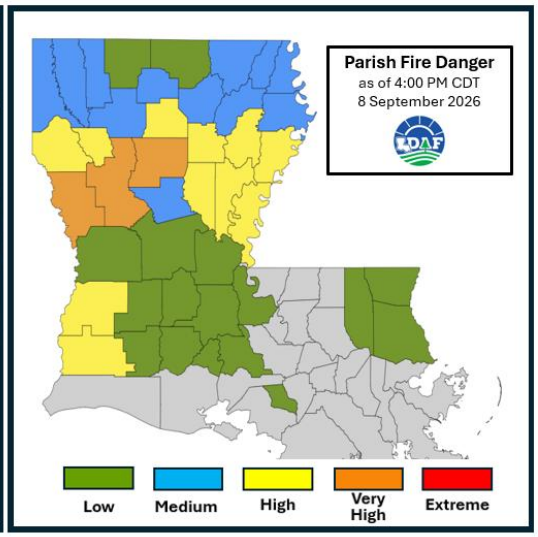

U.S. Drought Monitor (USDM): Issued September 10, 2026

- includes data thru September 08

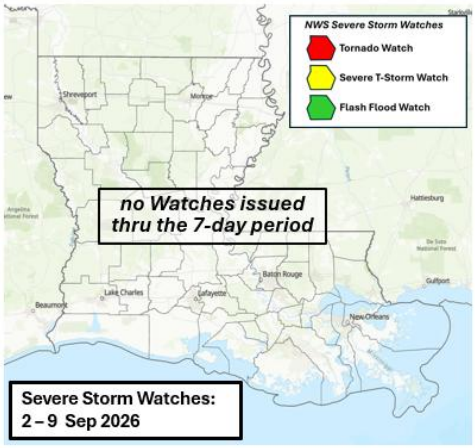

- daily rain coverage was pretty consistent during the monitoring period as the state was impacted by Edouard, a surface trough over the Gulf, then a front that meandered over the state; received amounts were generally near 7-day normals although amounts were generally less over the northern portion of the state
- received rain amounts were enough to slow drought expansion and even led to small areas of improvement; however, temperatures remained well above normal, keeping moisture demand high and reducing the impact of any precipitation
- the new ***U.S. Drought Monitor*** depiction showed some degradations, with an increase in 'Severe Drought' (D2) across northern portions of the state; yet the ***USDM*** also showed some pockets of improvements within the state for the first time in several weeks
- over 80% of the state is designated as being in drought, including just under 5% in 'Severe Drought' (D2)
- As of Sep 8, most LSU AgCenter parish agents reported 'Dry' or 'Very Dry' conditions across central and northern Louisiana, while agents across southeastern Louisiana noted 'Near Normal' or 'Wet' conditions; most agents noted that there was 'No Substantial Change' or 'Slightly Improved' conditions during the period
- as of Sep 8, the USDA noted 'Short' or 'Very Short' topsoil and subsoil conditions for 68% and 65% of the state, respectively; pasture and range conditions were noted as 'Fair', 'Poor', or 'Very Poor' for 57% of the state
- most parishes with 'Burn Bans' are located across central and northern Louisiana; parish Fire Danger levels were listed as 'High' or 'Very High' for about half of monitored parishes

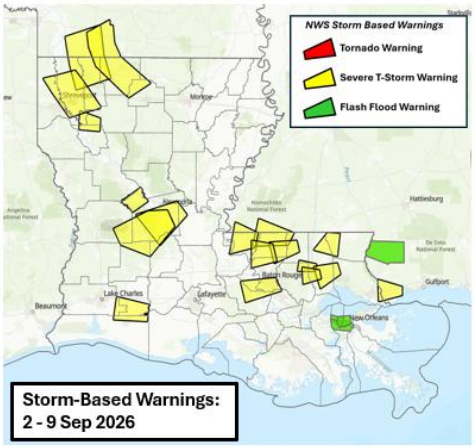

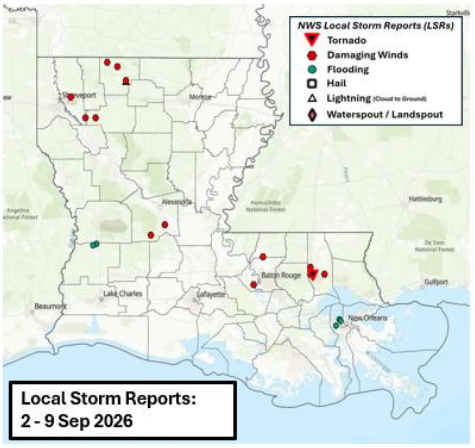

Parish ***Burn Bans*** are issued and lifted by local designated agencies and/or officials. ***Daily Fire Danger*** maps are produced by the USDA Forest Service, the Nat'l Interagency Fire Center (NIFC) & the LDAF.

Severe/Stormy Weather:

There were no *Severe Thunderstorm* or *Tornado Watches* issued during the period, but there was plenty of active weather, including a confirmed tornado near Hammond. Although a *Tornado Warning* was never issued, the tornado touched down on Sep 7 at 2:39 PM (CDT) and stayed on the ground for four minutes just to the west-southwest of Hammond. The tornado moved to the south-southwest and caused minor tree damage and the collapse of an exterior wall of a small professional building per the National Weather Service survey.

The tornado eventually tracked across Interstate 55 and caused additional minor tree damage.

The majority of the *Local Storm Reports* during the period were reported from Sep 5 through Sep 7 and were related to a surface trough that moved into the state from the Gulf and a front that moved into the state from the north (p. 6). The majority of the reports were for thunderstorm wind damage.

Tornado Reports: 02 - 08 September 2026 *(Preliminary)*

EF Rating	Date	Time (CDT)	Parish(es)	Peak Winds (mph)	Path Length (mi)	Path Width (yds)	Fatalities Injuries	Prop Dmg

T - Temperature (^{0}F) DFN - Departure from Normal P - Precipitation (in.) "-" indicates data not available "M" - missing observation(s)

Two key features during the week included the exit of T.S. Edouard from southwest Louisiana into East Texas late on Sep 1st. Central Louisiana residents were concerned about a repeat of CENLA's excessive rains and flooding linked to the remnants of June's Arthur over East Texas.

The other feature was the approaching cold front that stalled and lingered over northern Louisiana at the end of the 7-day period, prompting NWS *Severe T-Storm Warnings* and some pockets of wind-related damage over several southern parishes.

- Temperature (^{0}F) DFN - Departure from Normal P - Precipitation (in.) "-" indicates data not available "M" - missing observation(s)

Precipitation and temperature data are primarily retrieved through the ACIS QueryBuilder (rcc-acis.org) and the cli-MATE platform (MRCC Application Tools Environment), both of which are maintained by the NOAA Regional Climate Centers (RCCs).

Drought data are sourced from the U.S. Drought Monitor (unl.edu), the LSU AgCenter, and the Louisiana Dept. of Agriculture & Forestry.
