LOUISIANA WEEKLY CLIMATE SUMMARY
Volume 2, Issue 35
August 26 – September 01, 2026

Tropical Storm Edouard

The National Hurricane Center (NHC) began highlighting an area of low pressure in the northeastern Gulf on Friday, August 28th at 7:00 PM CDT. 24 hours later, the NHC tagged the area as Invest 97L.

NHC development chances for 97L slowly increased through the weekend with 97L getting labeled as Potential Tropical Cyclone #5 (PTC #5) at 10:00 AM CDT on Monday.

PTC #5 was upgraded to Tropical Depression #5 with Monday's 1:00 PM CDT Intermediate Advisory and then was upgraded again to Tropical Storm Edouard just 6 hours later.

T.S. Edouard remained a minimal and compact tropical storm through the night and into early Tuesday morning (Sep 1) as it headed towards Sabine Pass.

Edouard displayed strengthening and better overall organization through the morning and into the early afternoon of the 1st, with peak sustained winds increasing from 40 mph at 4:00 AM CDT to 60 mph just prior to landfall. During this period, Edouard maintained its compact wind field, with tropical-storm-force winds extending just 20-25 miles from the storm center in all four quadrants.

Landfall was at approximately 2:20 PM CDT on Tuesday (Sep 1) near Johnson Bayou (Cameron Parish) with peak sustained winds estimated at 60 mph and Edouard continuing to move to the northwest at 8 mph.

Fortunately for Louisiana, most of the heaviest rains were located south and west of the storm center as Edouard continuing to move to the northwest at 8 mph.

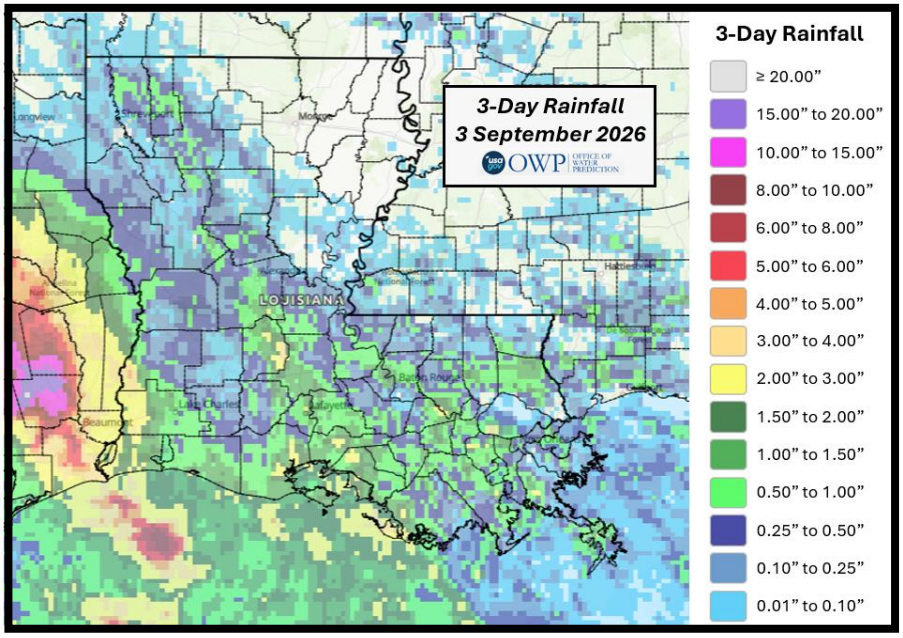

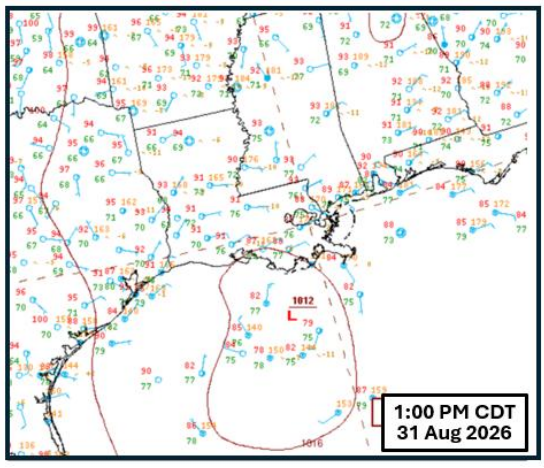

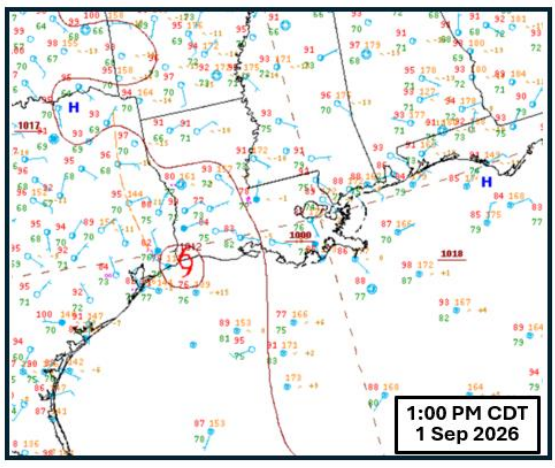

Table 1: Locations recording 3.00" of rain or more during Edouard (*Source*: NWS / Lake Charles)

Location	3-Day Rain Total	Parish	Weather Network
Vinton 1 SE	4.89"	Calcasieu	WeatherFlow
Vinton 3 S	4.34"	Calcasieu	HADS
Abbeville 1 SE	3.20"	Vermilion	NWS COOP
Abbeville 1.9 SW	3.00"	Vermilion	CoCoRaHS

Edouard quickly moved from extreme southwest Louisiana into southeast Texas, taking the heaviest rains with it. Radar estimates for the Pelican State indicate areas along the lower Sabine River with event totals of 3.00” to 5.00” of rain, but most of the state received less than 2.00” from the tropical system. Preliminary results indicate that only a handful of recording sites reported event totals of 3.00” or more (Table 1).

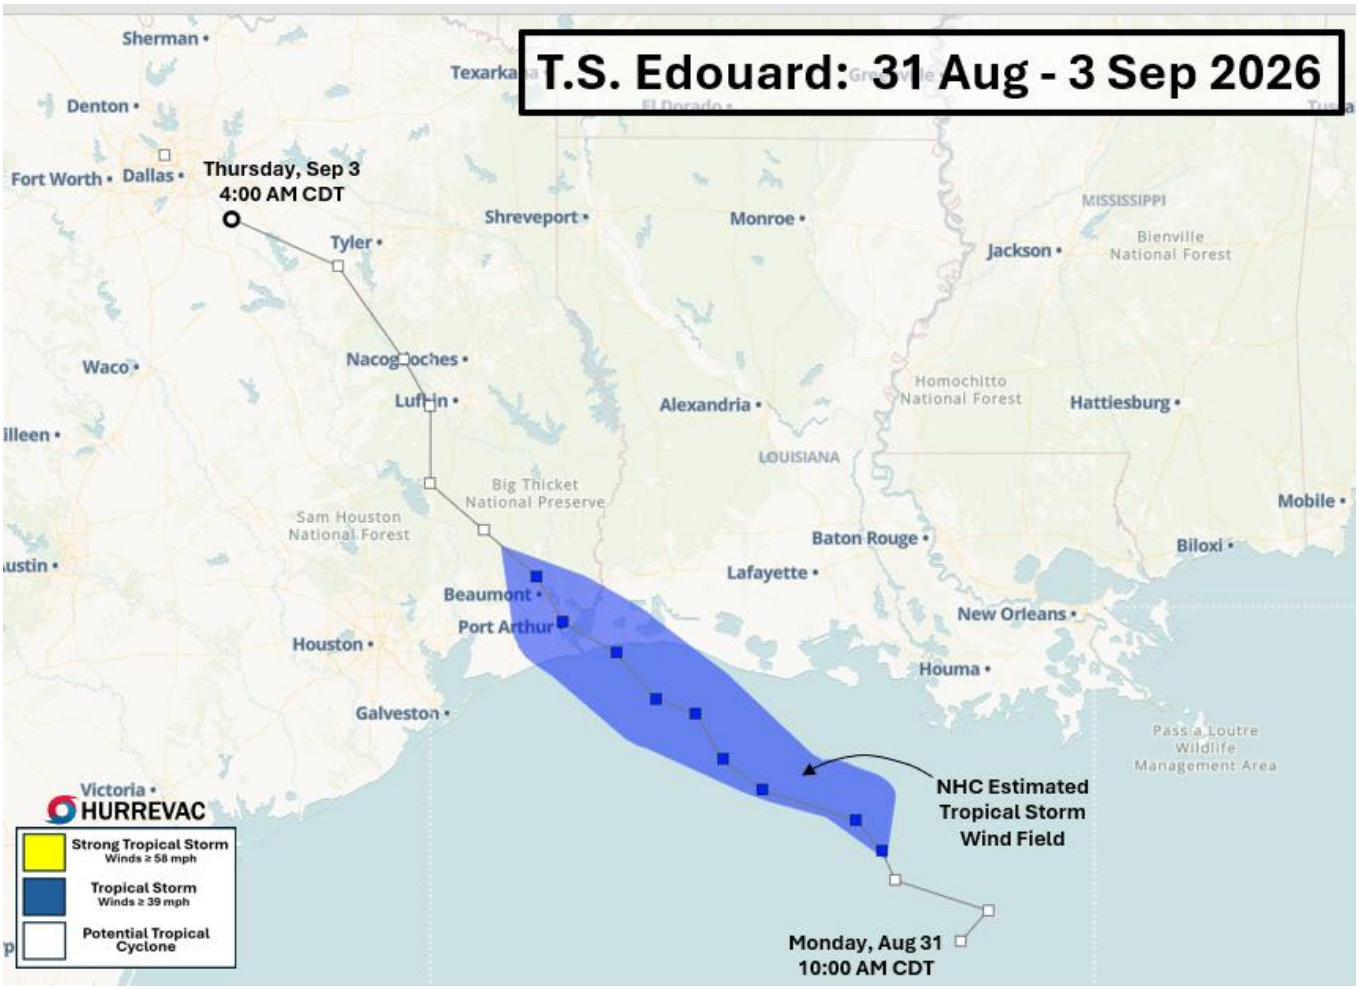

In addition, while there were spotty reports of wind damage and pockets of power outages across southwestern Louisiana, overall impacts were minimal given a landfalling tropical storm. Preliminary peak wind gusts (Table 2) were less than 70 mph statewide with tropical-storm-force wind gusts only recorded in Cameron Parish.

Even storm surge was more than manageable for most coastal areas, with most of the Louisiana coast seeing peak surge levels of less than 3.0 ft.

Table 2: Locations recording peak wind gusts ≥ 40 mph during Edouard (*Source*: NWS / Lake Charles)

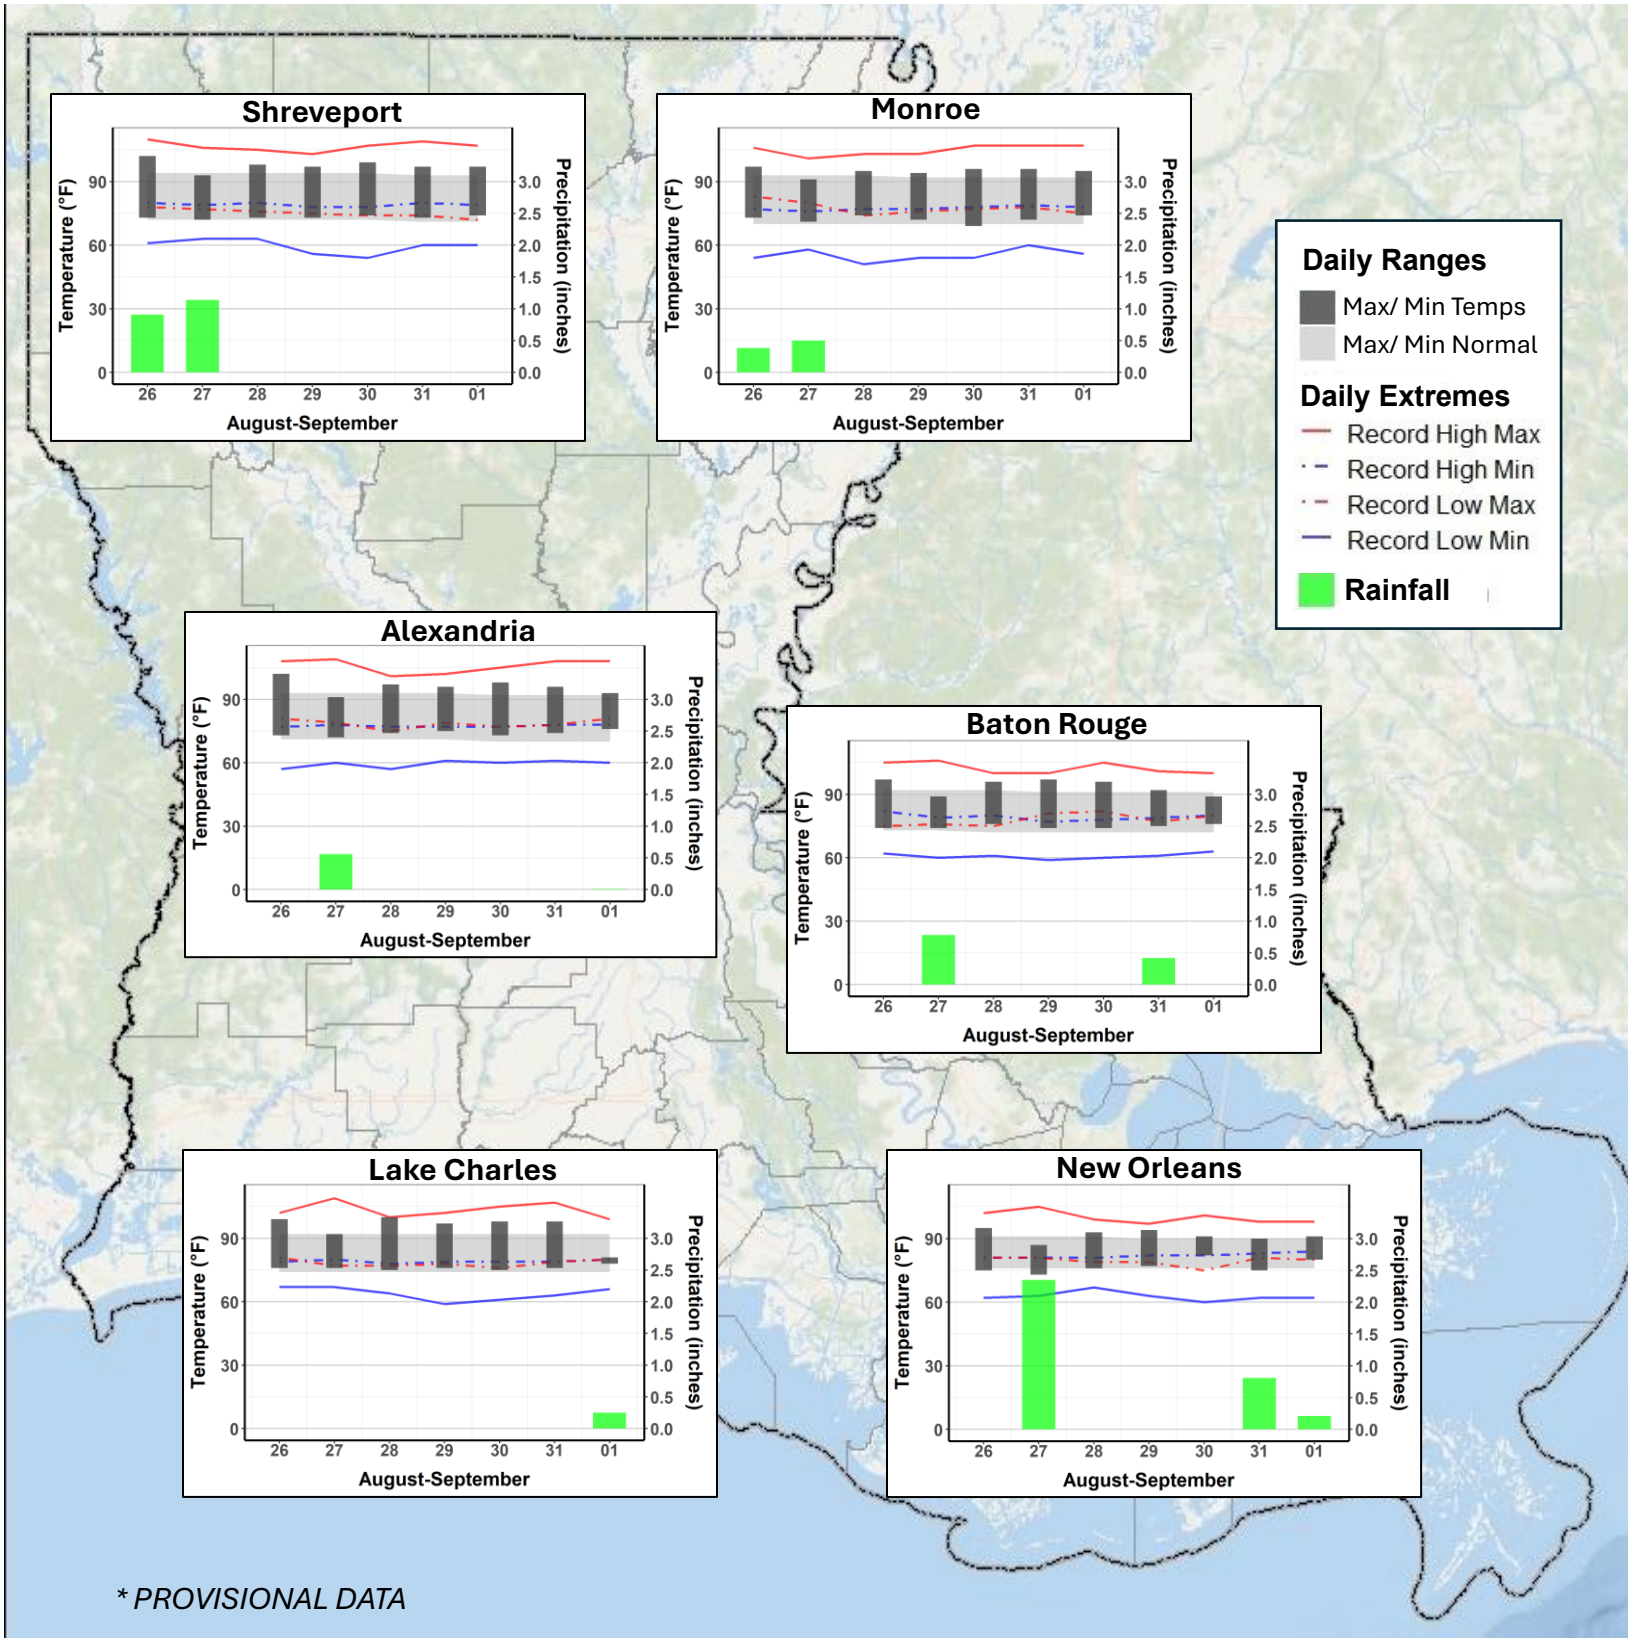

Location	Wind Gusts (mph)	Parish
Holly Beach 1 S	67	Cameron
Johnson Bayou 13 W	61	Cameron
Calcasieu Pass	52	Cameron
Cameron	48	Cameron
Sabine	45	Cameron

lastateclimate@lsu.edu
225-578-6870

7-Day Accumulated Rainfall & Average Temperatures: 26 Aug - 01 Sept 2026

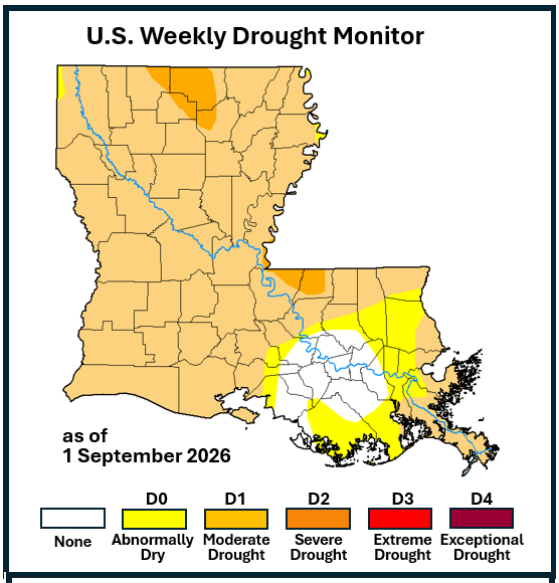

- Tropical Storm Edouard made landfall in Camron Parish on Sep 1st, but it was a compact storm with most of the heaviest rain staying off the Louisiana coastline (pp. 1-2)
- despite Edouard's landfall, much of the state received amounts below 7-day normals

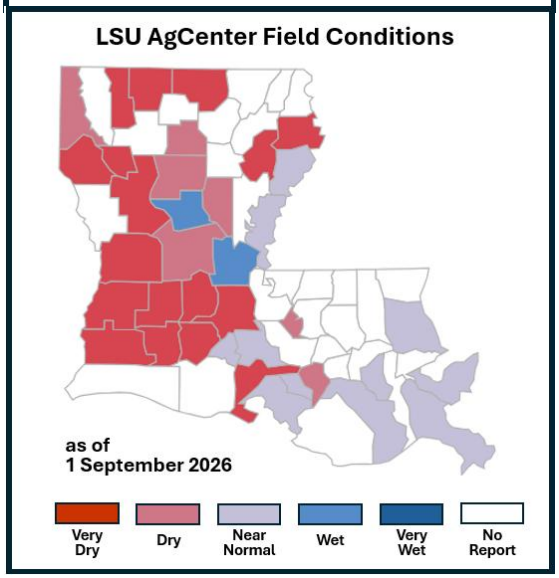

- it was another 7-day run of above-normal temperatures despite Edouard's landfall
- most climate divisions had at least one station exceed 100°F during the period (p. 6)
- drier air related to large-scale subsidence did allow for lows to drop into the 60°s for a couple of nights, including the statewide minimum of 65°F at Monroe 26 N recorded on Aug 30th

U.S. Drought Monitor (USDM): Issued September 03, 2026
- includes data thru September 01

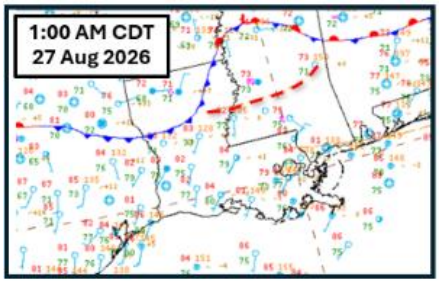

- areas across northern and southeastern Louisiana received some beneficial rains during the 7-day run, but they were only enough to halt degradations as the state is still reeling from several weeks of mostly dry and hot conditions
- above-normal temperatures increased already seasonally high moisture demand, and areas across southwestern Louisiana that did not receive as much rain despite Edouard's landfall saw conditions continue to deteriorate
- in response, the updated ***Drought Monitor*** showed 'Moderate Drought' (D1) expansion across southwestern Louisiana and an expansion of 'Severe Drought' (D2) across a portion of southeastern Louisiana that missed out on the heaviest rains
- ***drought now extends across more than 80% of the state***
- as of Sep 1, most LSU AgCenter agents noted 'Dry' or 'Very Dry' conditions in their parishes; several agents noted 'Near Normal' conditions across southeastern LA; while some agents did note improved conditions, most stated that conditions had worsened from the prior week
- as of Aug 31, 78% of topsoil and 74% of subsoil moisture levels are 'Short' or 'Very Short'; pasture and range conditions were 'Fair', 'Poor', or 'Very Poor' across 63% of the state
- a couple of parishes rescinded their 'Burn Bans' during the period bringing the total number to 24 as of Sep 2; parish Fire Danger levels were listed as 'High' or 'Very High' for roughly half of all monitored parishes

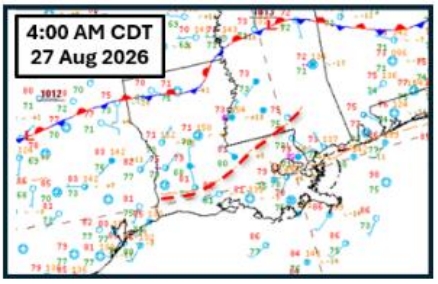

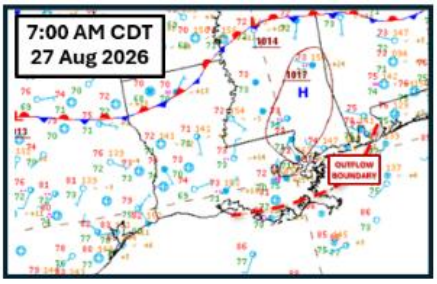

Parish ***Burn Bans*** are issued and lifted by local designated agencies and/or officials. ***Daily Fire Danger*** maps are produced by the USDA Forest Service, the Nat'l Interagency Fire Center (NIFC) & the LDAF.

Severe/Active Weather:

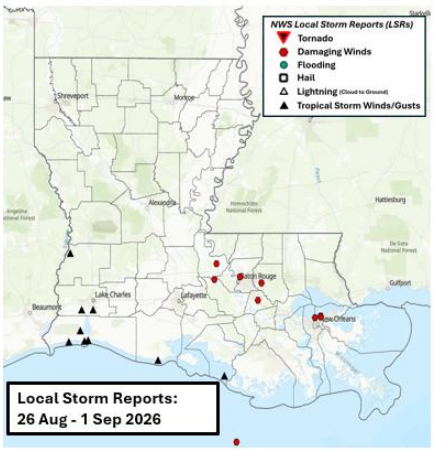

Besides Edouard's landfall, the stormiest day during the period was on Aug 27 as a cluster of storms moved through as a result of a southbound outflow boundary.

Several *Local Storm Reports* were received by the NWS across southeastern Louisiana, including one fatality when a tree fell on a camper resulting in one woman's death near Maringouin.

The other grouping of *Local Storm Reports* across southwestern Louisiana is related to Edouard. Two *Tornado Warnings* were issued during the 7-day stretch, but no confirmed tornadoes resulted.

Tornado Reports: 26 August - 1 September 2026 *(Preliminary)*

EF Rating	Date	Time	Parish(es)	Peak Winds (mph)	Path Length (mi)	Path Width (yds)	Fatalities Injuries	Prop Dmg
no NWS confirmed tornado reports at this time

T - Temperature (^{0}F) DFN - Departure from Normal P - Precipitation (in.) "-" indicates data not available "M" - missing observation(s)

Precipitation and temperature data are primarily retrieved through the ACIS QueryBuilder (rcc-acis.org) and the cli-MATE platform (MRCC Application Tools Environment), both of which are maintained by the NOAA Regional Climate Centers (RCCs).

Drought data are sourced from the U.S. Drought Monitor (unl.edu), the LSU AgCenter, and the Louisiana Dept. of Agriculture & Forestry.
